1. The first step in the process of creating a new product is to identify a market need. This involves conducting market research to understand what customers want and what problems they are facing.

2. Once a market need has been identified, the next step is to develop a concept for a product that addresses that need. This involves brainstorming ideas and creating a rough sketch of the product.

3. The third step is to create a prototype of the product. This allows the designer to test the product and see if it meets the market need.

4. After the prototype has been tested, the next step is to refine the product. This involves making changes to the design based on feedback from the testing process.

5. The final step is to launch the product into the market. This involves creating a marketing plan and promoting the product to potential customers.

Remarks

* Peterson said they improved the system for irrigation in 1952, but that a smaller system had been used there for about 20 years prior. The Petersons used the system for about 5 years by flooding from the ditch and sprinkling away the ditch. They have no immediate plans of using it again but may some time in the future.
