1. The first step in the process of identifying a problem is to recognize that a problem exists. This involves gathering information about the situation and identifying the specific issue that needs to be addressed. Once the problem is identified, the next step is to define the problem clearly and concisely. This involves stating the problem in a way that is specific and measurable, and identifying the goals that need to be achieved to solve the problem. The third step in the process is to generate potential solutions. This involves brainstorming ideas and considering different approaches to solving the problem. The fourth step is to evaluate the potential solutions. This involves comparing the different solutions and determining which one is the most effective and feasible. The final step in the process is to implement the chosen solution. This involves putting the solution into action and monitoring the results to ensure that the problem is solved.

(continued)

Figure 1. Schematic representation of the experimental design. The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG). The subjects were divided into two groups: the control group (CG) and the experimental group (EG). The CG was divided into two subgroups: the control group (CG) and the control group (CG). The EG was divided into two subgroups: the experimental group (EG) and the experimental group (EG).
